HackIIITD 2026 | Round 1 Idea Submission

NoticeGuard

A verified-source watchdog that turns official government-exam notices into clear, timely alerts for aspirants

Team TheHouse

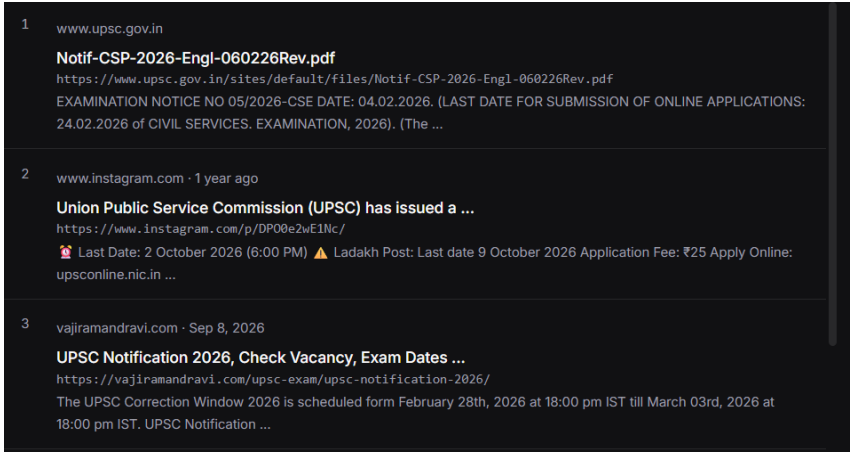

Ayush Kaushik

Devin Anand

Powered by the TinyFish API

Problem: aspirants cannot easily find the official notice

- Notices, corrigenda, date changes and results are spread across dozens of commission sites, mostly as PDFs, with no API.
- In our live test, only 2 of the first 9 search results for a UPSC notification query came from upsc.gov.in. The rest were Instagram, LinkedIn, YouTube and coaching blogs.
- SSC alone posted 5 notices in 6 days (7 to 12 Oct 2026): a shortlisting, answer keys, vacancies and a final result.
- A missed or misread notice means a missed deadline or preparing against outdated information.

Live TinyFish Search: 10 results in 1.2s for a UPSC notification query. Only upsc.gov.in results are official.

Proposed solution: official updates, without the noise

1

Pick your exams

UPSC, SSC, DSSSB and state PSCs. Choose WhatsApp or Telegram for alerts.

2

We watch official sources

TinyFish reads commission sites and notice PDFs, and detects what changed.

3

Get a verified alert

A plain-language summary: what changed, old and new dates, and the source link.

What makes it different

- Verified official source tag: only .gov.in and .nic.in sources are trusted, so fake notices are filtered out.
- Change detection: an old date to new date highlight when a deadline moves.
- Source evidence: every alert links to the original PDF so the aspirant can check it.

Target users

Primary: exam aspirants

- UPSC, SSC and state PSC candidates who track several exams at once
- Need one trusted place for official updates, not scattered social posts

Secondary: coaching communities

- Institutes and study groups that relay notices to hundreds of students
- Can share verified alerts instead of forwarding unchecked screenshots

We start with UPSC and SSC, then expand to state commissions.

Technical architecture and stack

Planned stack

React Native (Expo) app | Python or Node backend | PostgreSQL | Scheduler for watch jobs | WhatsApp / Telegram Bot APIs | LLM API for classification and summaries

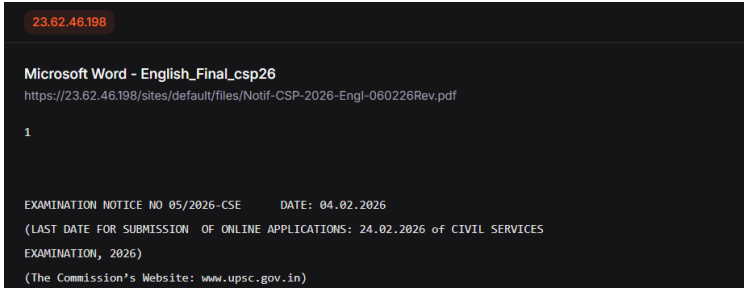

How do you plan to integrate the TinyFish API?

Stage	TinyFish API	What it does
1. Discover	**Search**	Finds candidate notice pages per exam. We keep only .gov.in and .nic.in results (see slide 2).
2. Read	**Fetch**	Turns the full official PDF or page into clean Markdown for the LLM. Tested on the UPSC CSE 2026 notice (about 10s).
3. Navigate	**Agent**	Operates notice boards that have no API. Tested on ssc.gov.in: 5 latest notices returned as JSON.
4. Watch	**Monitor (planned)**	Detects page changes and triggers stages 2 and 3, so alerts are near real time.

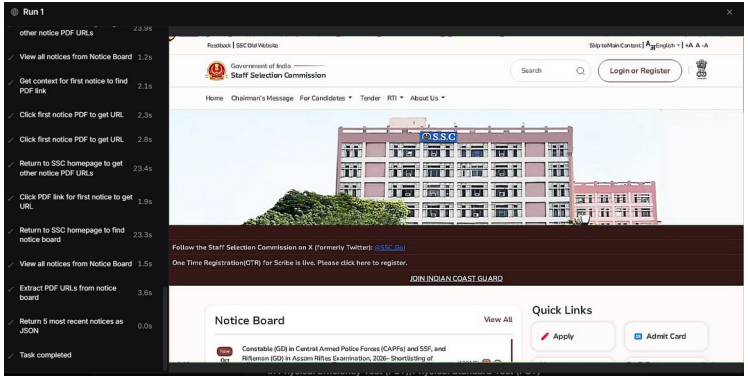

Output our app stores per notice

```
{ exam, type, old_date, new_date, source_url,
verified_official }
```

Fetch and Search are free, so the Agent is used only where a page needs navigation.

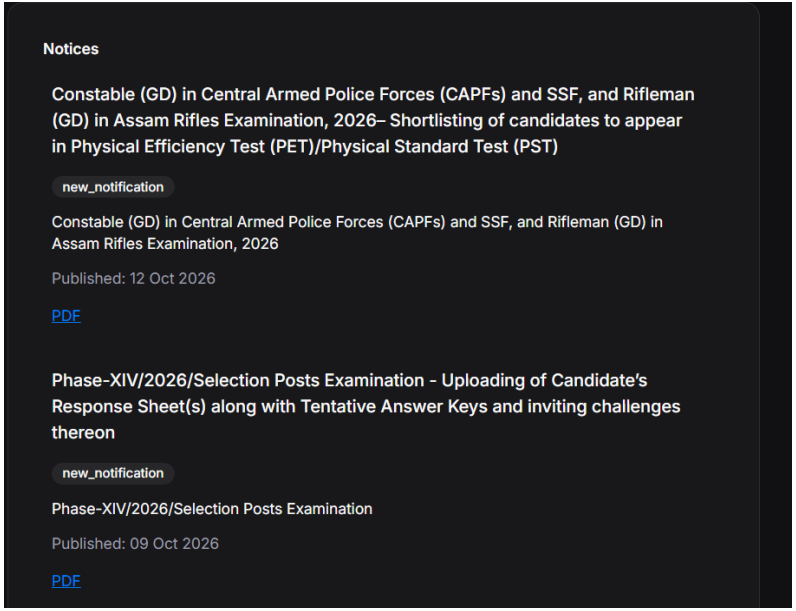

Fetch: official UPSC CSE 2026 notice as clean text (200 OK, 9.5s).

Agent: live run on ssc.gov.in, navigating the Notice Board without an API.

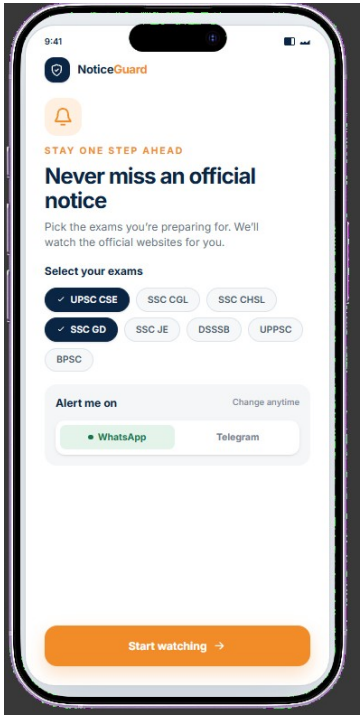

Scalability, feasibility and use case

- Scalable: each new commission is one configuration entry (site, exam, watch interval). Search and Fetch are free, and the Agent is used only where navigation is needed.
- Feasible: working Search, Fetch and Agent runs on the live UPSC and SSC websites, no scraping rules written by hand.
- Honest limits: read-only, public pages only. No logins, captcha or form filling. The Agent returned coarse notice types, so classification is done in our LLM layer.
- Use case: an aspirant gets the same-day alert for an answer key, shortlisting or deadline change, with the original PDF attached.

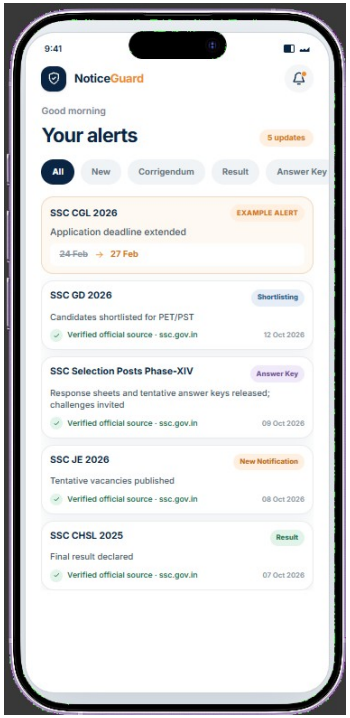

Agent output from ssc.gov.in: titles, dates and types as structured data (first two of five shown).

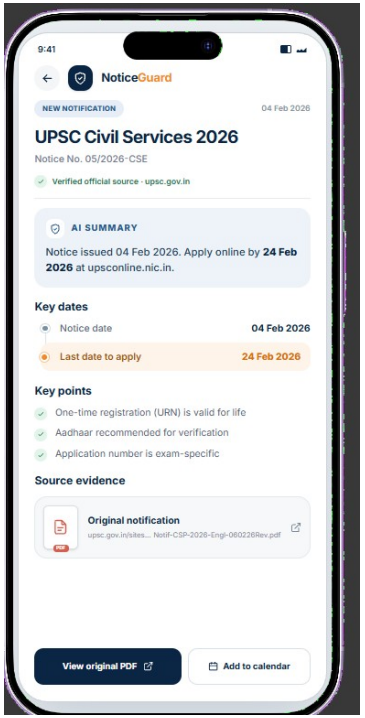

Prototype: three core screens

1. Pick exams

2. Verified alert feed

3. Notice detail with source evidence

Built with Figma Make. The SSC CGL date-change card is a sample alert; all other cards use real notices.

Impact and roadmap

Impact

- Fewer missed deadlines and corrigenda
- One trusted, verified source instead of scattered posts
- Hours saved scanning commission websites
- Shows how web agents can make non-API public data usable

Roadmap

Phase 1

UPSC and SSC alerts via WhatsApp / Telegram

Phase 2

State PSCs (DSSSB, UPPSC, BPSC) and Monitor-based change detection

Phase 3

Regional languages, eligibility matching, calendar sync
